Neon DB is a cloud-native PostgreSQL database platform that separates storage and compute, making databases faster, scalable, and cost-efficient. It provides features like instant database branching, automatic scaling, serverless architecture, and developer-friendly APIs.

Short Text:

Neon DB is a modern serverless PostgreSQL database designed for cloud applications. It allows developers to create scalable databases without managing servers. With features such as automatic scaling, database branching, and pay-as-you-use pricing, Neon simplifies database management and accelerates application development. It is commonly used for web applications, SaaS products, AI projects, and backend services.
